MeD Practical Case

Collaborative Travel Planner

Anxo Pérez - anxo.pvila@udc.es
Paloma Piot - paloma.piot@udc.es

Practical Lessons Organisation (I)

- **40%** of the final grade.
- **Multiple iterations** using different development methodologies.
- Groups of **6 people:**
    - Mail **both** teachers with the name of the application, the group you are enrolled, the group you would like to attend and the names and email addresses of each member.
    - **Deadline for creating groups!: 13/09/2026**
- **Coordinated with FD** (same groups in both subjects).
    - *In case of only coursing MeD, talk to the teacher to be assigned to a group.*

Practical Lessons Organisation (II)

- The evaluation will be based on both the **correct use of the methodologies**, the accomplishment of the requirements, and how that influenced the overall **quality of the project** and **team productivity**
    - So keep in mind to actually take advantage of the methodologies for **improving your project**, not only using them as a mandatory overload.

Please, remember **this IS NOT a programming course**

- **Collaborative Travel Planner:** Your work will consist of extracting the requirements and implementing a web application that allows groups of users to collaboratively plan and manage their trips, **following different development methodologies.**

- You will start with the same base application, and through the final iterations, some requirements and use cases will change depending on the group.

- **(27/09/2026)** Standard users can create their profile with their unique login, password, name and avatar. A user can then create a trip, with a title, a description and start and end dates. Every trip contains an ordered route: a sequence of legs where each leg records its origin, its destination, the departure and arrival date and time, and the transit mode used (flight, train, bus, car or ferry). When accessing the platform, users should be able to see the list of their trips and open one to inspect its route.
    - If you do not know about your task: **talk to your client**, see the landscape, explore the domain, that's one of the key tasks for a software engineer.
    - Play with the archetype we will provide to you, explore the frameworks and technologies, follow tutorials, this is real-life, **we do not answer programming questions.**

- You will have to deliver a **report (PDF)**, in which you will explain the process followed to develop the application, applying an organization **without following any specific methodology.**
- You are a group of 5-6 developers, organize your work accordingly to reach your deadlines. This is essential for your success.

- There will be a **defense** in which you will have to **expose the functionalities developed** as agreed with the client.
- Defenses are mandatory, and **all the members of the group must be present** during them.

- **(25/10/2026)** For this iteration, there are no predefined requirements. You will follow the **SCRUM** methodology therefore, during the SCRUM ceremonies, you will be in contact with the Product Owner and Stakeholder to **extract the requirements**.
    - 3 Sprints of 1 week.
    - In class, we will hold the SCRUM ceremonies.
        - Planning, Review and Retro.
        - 1 different Scrum Master in each Sprint

- **(25/10/2026)** Just for a quickstart... As **Product Owners**, we would love to implement the next:
    - Trips are now collaborative. A trip owner can invite other registered users, who should be notified and able to accept or decline. Once they join, members can view and edit the shared trip and its itinerary.
    - Users should also be able to see the route on a map and add accommodation stays, with transport and accommodation shown together in chronological order. Finally, trip members need to manage travel documents associated either with the whole trip or with an itinerary item.

Iteration 2 (II)

- You will have to deliver a **report (PDF)**, in which you will explain the process followed to develop the application **SCRUM.**
- There will be a **defense** in which you will have to **expose the functionalities developed** as agreed with the client.
- Defenses are mandatory and **all the members of the group must be present** during them.

- You will have to deliver a **report (PDF)**, in which you will explain the process followed to develop the application **SCRUM.**
- This report will serve as evidence of your process and collaboration.
    - **Roles performed:** Describe how you distributed roles.
    - **Product Backlog:** Explain how it was created, refined, and prioritized.
    - **Sprint Backlogs:** Provide the backlog of each sprint (3 total).
    - **Ceremonies:** Summarize the main conclusions of Planning, Review, and Retrospective.
    - **Planning vs. Reality:** Compare the initial estimation of user stories (story points) with the final result.
    - **Responsibilities:** Indicate which members implemented each user story or task.
    - *You may use any app to manage your Scrum boards, story points, and burndown charts. Screenshots are welcome.*
